It takes many hours and considerable care to apply the finish to a Volvo. The main stages of our paint process are illustrated in this photograph. After undergoing a phosphate treatment which cleans and etches the sheet metal to ensure that the paint adheres to

the body, each Volvo is then dipped in a primer bath. It then receives in succession: abrasive resistant paint, stone-chip resistant paint below the beltline, surfacer, sealer and finally a top coat. A clear lacquer seals in metallic colors and increases their brilliance.
