

# Cold facts about Volvo Air Conditioning 1973

# What is the difference between these two Volvo owners?

**One of them has a Volvo Air Conditioner in his car!**

The climatic control unit which makes  
the car cool and comfortable – and the driver safer in traffic.

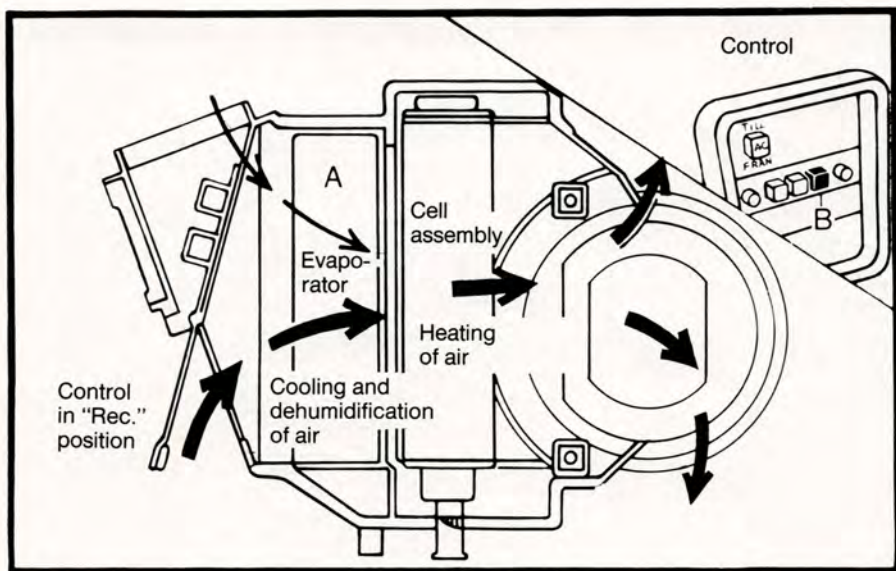

# This is how Volvo Air Conditioning works

1973 model of Volvo cars can be obtained preadapted for a Volvo Air Conditioner. However, in the case of the 140 Series, this must be ordered in advance. The original heating and ventilation unit is complemented with an evaporator (A). Air is inducted by a fan and then passes through the evaporator, where it is cooled and demoi-strurized. Then it flows on through a core where it regains the temperature you require.

The Volvo Air Conditioner works just as well in both open and closed systems (recirculation).

The cool air can be regulated through the four independant jets in the instrument panel, as well as through the other air jets in the car.
